

Core Banking Adapter – Payment API Specification

Document Control

Document ID: INT-API-PAY-023 | Version: 2.6 | Owner: Integration Engineering | Status: Approved

POST /accounts/validate

Validates account eligibility. Request includes account reference and transaction context. Response includes validation status and reason code.

POST /payments

Creates a payment instruction using source account, destination account, amount, currency and client correlation ID.

GET /payments/{id}

Returns payment status: RECEIVED, VALIDATED, PENDING, COMPLETED, REJECTED or FAILED.

Errors

400 invalid request; 401 authentication failure; 403 authorization failure; 409 duplicate/conflicting state; 5xx service or downstream failure.

Security

Token-based authentication is required. Correlation IDs are propagated. Sensitive values must not be written to application logs.

Operations

Requests should be idempotent where applicable. Timeouts and retry policies must be explicitly configured.
