

1-Month AI Curriculum

AI Business Consultant / AI Solution Consultant / AI Solution Architect Track

Duration: 4 weeks **Schedule:** 5 days/week × 2 hours/day = 40 hours

Learning approach: 30% concepts + 40% business case exercises + 30% solution architecture. The curriculum is designed for a candidate with stronger business/consulting experience who needs to build AI solutioning and architecture capability.

Week 1 — AI Foundations for Business Consulting

Objective: Build enough technical understanding to confidently discuss AI with business stakeholders, architects and engineering teams.

Day	Topic	Expected Learning
1	AI Landscape	AI vs ML vs Deep Learning vs Generative AI vs Agentic AI
2	LLM Fundamentals	LLMs, tokens, context window, inference, hallucination, temperature
3	GenAI Capabilities	Generation, summarization, classification, extraction and reasoning
4	Prompt Engineering	System/user prompts, few-shot prompting and structured outputs
5	Enterprise GenAI	Use cases, limitations, security, governance and responsible AI

Business exercise: Take five business processes such as customer service, procurement, IT asset management, finance and HR. For each, identify Business Problem → AI Opportunity → AI Use Case → Expected Benefit.

Week 2 — AI Use-Case Discovery, Business Case, RAG & Enterprise Data

Day	Topic	Expected Learning
6	AI Discovery Workshop	Identify AI opportunities from business problems
7	AI Use-Case Prioritization	Prioritize using business value, feasibility and risk
8	Business Case Development	ROI, cost savings, productivity and revenue
9	Enterprise Data for AI	Structured/unstructured data, quality and metadata
10	RAG	Documents → chunks → embeddings → vector DB → retrieval → LLM

Discovery framework: Business Process → Pain Point → Root Cause → AI Opportunity → AI Use Case → Business Value → Technical Feasibility → Risk → Recommendation.

Week 3 — Agentic AI & Solution Architecture

Day	Topic	Expected Learning
11	What is Agentic AI?	Agent vs chatbot vs workflow
12	Agent Architecture	Agent, tools, memory, knowledge and reasoning
13	Multi-Agent Systems	Supervisor, specialist agents and orchestrator
14	Tool Calling + MCP	How agents interact with enterprise systems
15	Agentic Architecture	Design an end-to-end enterprise agent solution

Architecture practice: User → AI Orchestrator → Specialized Agents → RAG/Knowledge Layer → Enterprise Data & Systems → Security, Governance & Monitoring.

Week 4 — AI Solution Architect & Consulting

Day	Topic	Expected Capability
16	AI Solution Blueprint	Convert business requirements into AI architecture
17	Reference Architecture	Application, AI, data and integration layers
18	AI Platform Evaluation	Evaluate major enterprise AI platforms and options
19	AI Governance & Security	IAM, data security, PII, guardrails and auditability
20	AI Roadmap	PoC → MVP → Production → Scale

Days 21–25 — Enterprise Capstone Project

Project: AI-Powered IT Operations & Asset Management Platform

Design an enterprise AI system for an organization with thousands of IT assets, procurement data, inventory data, service tickets, repair records and disposal records.

Recommended agents:

- Asset Intelligence Agent — locate assets and identify underutilization.
- Procurement Agent — determine whether new purchases are required.
- Lifecycle Agent — recommend repair, reuse or replacement.
- Compliance Agent — identify compliance issues.
- Disposal Agent — recommend assets ready for disposal.
- Reporting Agent — generate KPI, exception and management reports.
- Orchestrator — route each request to the appropriate agent.

Capstone Architecture

Business User → Enterprise AI Assistant → Agent Orchestrator → Specialized Agents → RAG/Knowledge Layer → Enterprise Data → ITAM/ERP/SharePoint/SQL/APIs → Security + Governance + Monitoring

Business Case Exercise

Example: If an organization has 10,000 manual hours/year and AI automates 70%, estimate 7,000 hours saved. Then calculate annual benefit, implementation cost, net business value and ROI.

Days 26–30 — Interview & Role Simulation

- **Day 26:** Discovery workshop simulation — reduce customer-service costs.
- **Day 27:** Identify and prioritize five AI use cases using value, feasibility and risk.
- **Day 28:** Architecture interview — design an Agentic AI customer-service solution.
- **Day 29:** Executive presentation — Problem → Solution → Architecture → Business Value → Roadmap.
- **Day 30:** Full mock interview covering consulting, GenAI, RAG, Agentic AI, architecture, data, security, governance and ROI.

Target Capability After One Month

The candidate should be able to conduct an AI discovery workshop, identify and prioritize AI opportunities, develop a business case, translate requirements into an AI solution blueprint, design an agent-driven process at a high level, define data and RAG requirements, evaluate AI platforms, collaborate with technical architects, and define an implementation and value-realization roadmap.

Priority of Learning

Skill	Priority
AI Business Consulting	★★★★★
AI Use Cases	★★★★★
Agentic AI Architecture	★★★★★
Solution Blueprinting	★★★★★
Business Case / ROI	★★★★★
Enterprise Data	★★★★

Skill	Priority
RAG	★★★★
AI Governance	★★★★
AI Platforms	★★★★
Prompt Engineering	★★★
Python	★★
ML Algorithms / Deep Learning Coding	★

Positioning: Business + Process + Automation + Emerging AI → AI Business Consultant → AI Solution Consultant → AI Solution Architect.
